Measurement Overview

umlaut tested and measured the performance of its voice and data services on smartphones in comparison to other 5G/LTE/UMTS mobile radio networks in metropolitan and rural areas of Greece.

The audit was done as a performance benchmark performed by umlaut between 10.04.2021 and 23.04.2021 in cities and towns as well as on connection roads.

Dedicated measurements have been executed as drive tests outdoors using a Samsung Galaxy S10 and Samsung Galaxy S21+ Smartphone. All data measurements have been performed in 5G and 4G preferred mode. Voice measurements have been done in 4G preferred mode on both sides, while call origin has been alternated.

In addition crowdsourced performance data has been collected and evaluated between CW45 2020 and CW15 2021.

The following pages provide a comparative overview about the performance results observed for the different tested service types.

Methodology

The leader in mobile benchmarking, umlaut, has analyzed the mobile networks of Greece with regards to mobile network performance. We measure smartphone voice and data performance based on extensive drivetests – from major metropolitan areas to smaller cities and connection roads.

We objectively define the routes and test methodology and publish the results through certificates or public benchmark reports.

As the de-facto industry standard, our benchmarking methodology focuses on customer-perceived network quality and covers a wide range of mobile services. Today, more than 200 mobile networks in more than 120 countries are being evaluated by our unique scoring methodology. It allows a technical analysis that is unpre-

cedented in its level of detail and enables comparisons between the network performance and capability of each mobile network. Our public benchmarks as well as the certificate benchmarks help network operators to demonstrate how well they are delivering wireless connections to consumers, business users and enterprises and reveals the areas of improvement.

Score and breakdown

Cosmote achieved the highest overall score among competitors with 905 dots out of 1000.

At the start of the benchmark, the measurement setup did not support enhanced voice services (EVS) with VoLTE for Wind. It is to be expected that the speech quality experienced by Wind users is higher than that measured.
